

Diabetes Analysis Report

Patient Name

John Doe

Prediction

Not Diabetic

Glucose Distribution Analysis

This graph compares the patient's glucose level against healthy and diabetic populations.

- Green distribution represents healthy patients.
- Red distribution represents diabetic patients.
- Blue marker indicates the patient's glucose measurement.
- Higher glucose levels are strongly associated with diabetes risk.

BMI Distribution Analysis

Body Mass Index (BMI) is an important health indicator commonly associated with diabetes development.

- Higher BMI values may indicate increased metabolic risk.
- Distribution overlap helps compare healthy and diabetic populations.
- Blue marker shows the patient's relative BMI positioning.

Insulin Distribution Analysis

This violin plot visualizes insulin level distribution among diabetic patients.

- Wider regions indicate more commonly occurring insulin measurements.
- Quartile markers summarize the overall population spread.
- The blue marker indicates how the patient compares against diabetic population patterns.

Patient Health Comparison

Feature	Healthy Median	Your Value
Glucose	107.0	140.0
BMI	30.05	28.5
Age	27.0	35.0
Diabetes Pedigree Function	0.34	0.63
Insulin	39.0	120.0
Blood Pressure	70.0	80.0

How to Read This Table

- Healthy Median represents the median value observed among healthy patients in the dataset.
- Your Value represents the patient's submitted clinical measurement.
- Large deviations from healthy median values may indicate elevated diabetes risk.
- This comparison highlights which clinical features differ most significantly from healthy population patterns.

AI Attention vs Patient Profile

This graph explains how the AI model analyzed the patient's clinical profile.

- Gray bars represent how important each feature was during prediction.
- Blue X markers represent the patient's relative feature strengths.
- Features with larger bars had greater influence on the AI model's decision.
- Patient markers positioned toward higher values on important features may contribute more strongly toward diabetes prediction.
- This visualization improves interpretability by explaining which clinical measurements affected the analysis most significantly.
