

Heart Disease Analysis Report

Patient Name

John Doe

Prediction

Heart Risk Detected

Cholesterol Distribution Analysis

This graph compares the patient's cholesterol level against healthy and heart disease populations.

- Green distribution represents healthy patients.
- Red distribution represents heart disease patients.
- Blue line indicates the patient's cholesterol measurement.
- Higher cholesterol levels may indicate increased cardiovascular risk.

Maximum Heart Rate Analysis

This visualization compares the patient's maximum heart rate against healthy and heart disease populations.

- Distribution spread represents population variability.
- Blue marker represents the patient's relative position.
- Abnormal positioning may indicate cardiovascular stress.
- Lower maximum heart rates are often associated with heart disease risk.

ST Depression (Oldpeak) Analysis

Oldpeak measures exercise-induced ST depression, an important indicator in heart disease analysis.

- Higher oldpeak values may indicate cardiac stress.
- Blue line represents the patient's measurement.
- Distribution comparison helps estimate abnormality.
- Elevated values may contribute more strongly toward heart disease prediction.

Patient Health Comparison

Feature	Healthy Median	Your Value
Chest Pain Type	2.0	0.0
Maximum Heart Rate	161.0	150.0
ST Depression (Oldpeak)	0.2	1.4
Major Vessels	0.0	2.0
Age	52.0	20.0
Thalassemia	1.0	3.0
Cholesterol	234.5	240.0

How to Read This Table

- Healthy Median represents the median value observed among healthy patients in the dataset.
- Your Value represents the patient's submitted clinical measurement.
- Large deviations from healthy median values may indicate elevated cardiovascular risk.
- This comparison highlights which clinical features differ most significantly from healthy population patterns.

AI Attention vs Patient Profile

This graph explains how the AI model analyzed the patient's clinical profile.

- Gray bars represent how important each feature was during prediction.
- Blue X markers represent the patient's relative feature strengths.
- Features with larger bars had greater influence on the AI model's decision.
- Patient markers positioned toward higher values on important features may contribute more strongly toward heart disease prediction.
- This visualization improves interpretability by explaining which clinical measurements affected the analysis most significantly.
